

Companies require modern network environments as a basic prerequisite for secure IT

SEH Computertechnik GmbH makes first appearance at the it-sa IT Security Expo & Congress in Nuremberg

From October 8th to 10th, decision-makers and experts will once again be gathering information on current IT security trends at it-sa in Nuremberg. This year's trend topics include cyber security, data protection, artificial intelligence and of course the (industrial) Internet of Things.

For the very first time, SEH Computertechnik GmbH from Bielefeld will also be participating in the show. The network specialists will be presenting their current product portfolio in Hall 11 at booth 11.0-102. SEH will be showing how to integrate non-network-enabled devices easily and precisely into the company network - regardless of whether it is tried and tested or older technology that is to be used further or devices that are not intended for use in networks per se. Of course, all security aspects are taken into consideration.

At the booth, the SEH team will be explaining how the SEH USB Dongle Servers and USB Device Servers enable dedicated network access to allocated USB devices. The experts from SEH Computertechnik GmbH draw on their in-depth knowledge of IT security and explain how secure data transfer is ensured and outline dangers and countermeasures for typical attack scenarios. SEH provides solutions for all types of network sizes including small to medium-sized companies or enterprise environments.

The current SEH product portfolio is rounded off with print servers and other intelligent solutions for printing via networks.

Note to editors: The SEH trade fair team, consisting of support, product management and sales, is looking forward to a lively exchange. Please send any meeting requests promptly by e-mail to seh@vibrio.de.
